

## Tomcat 8 Installation - Windows Environment

July 2015

## **Document Control**

Version	Date	Author	Notes
1.0	13 July 2015	C Edwards	First release.

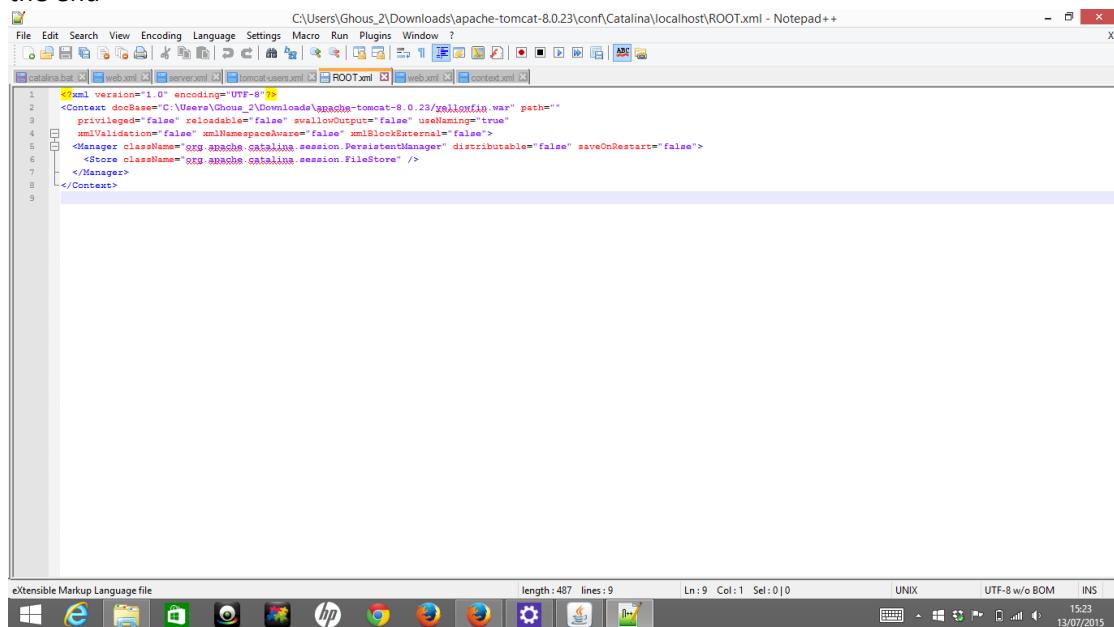

**NOTE:** *These instructions are written as a simple step by step guide. They are specifically for the Microsoft Windows™ environment. Screen shots have been taken, to emphasise the installation, from a Windows 8 environment.*

### **Assumptions**

It is reasonably assumed that a level of IT competence is available for these instructions to be followed. It is also assumed that Windows has been installed and is up-to date, functioning as expected, with internet connectivity and no additional internet services running on the device intended to be used with these instructions.

## Installation Guide

1. Download the relevant Tomcat 8 package for your environment from:  
<https://tomcat.apache.org/download-80.cgi>
2. Ensure you note the directory you place the unpackaged files, you will need this in a later stage.
3. If you haven't already, Install Yellowfin as normal and install the License.
4. Navigate to your Yellowfin folder and into the appserver/webapps/ROOT folder. Select and copy all files and folders.
5. Navigate to your new Apache Tomcat directory and into the webapps folder.
6. Rename the exiting ROOT folder to ROOTOld
7. Create a New ROOT folder and enter the folder
8. Paste all folder and items selected and copied in point 4
9. From the Yellowfin Root directory, copy the yellowfin.war file to the new root of Tomcat 8 (i.e. the same folder as the bin/BirtResources etc) make note of this directory.
10. Copy the ROOT.XML file from your old yellowfin7.1/appserver/conf/Catalina/localhost folder to the new tomcat 8 conf/Catalina/localhost directory.
11. Edit the ROOT.XML within the new tomcat conf/Catalina/localhost directory, file replacing the docBase reference to the new directory taken at point 9 and ensure /yellowfin.war is appended to the end

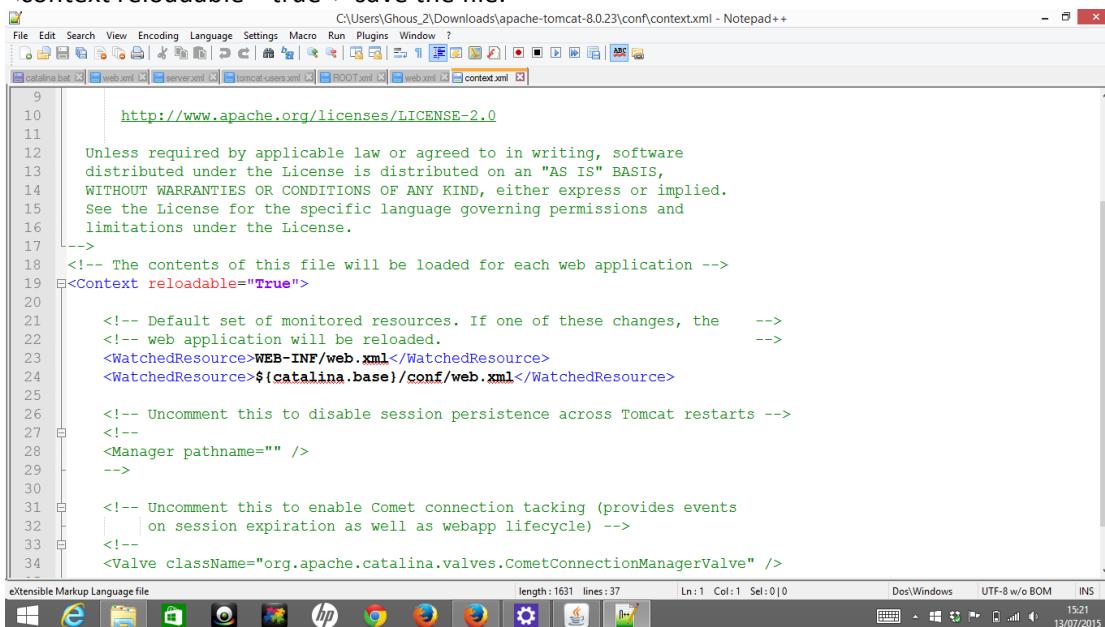

The screenshot shows the Notepad++ application window with the file C:\Users\Ghous\_2\Downloads\apache-tomcat-8.0.23\conf\Catalina\localhost\ROOT.xml open. The XML code is as follows:

```
<?xml version="1.0" encoding="UTF-8"?>
<Context docBase="C:/Users/Ghous_2/Downloads/apache-tomcat-8.0.23/yellowfin.war" path=""
privileged="false" reloadable="false" swallowOutput="false" useNaming="true"
antiValidation="false" xmlns:java="http://java.sun.com/xml/ns/javaee" xmlns:catalina="http://jakarta.apache.org/tomcat/catalina"
catalina:type="Context" catalina:version="1.0">
<Manager className="org.apache.catalina.session.PersistentManager" distributable="false" saveOnRestart="false"/>
<Manager className="org.apache.catalina.session.FileStore" />
</Manager>
</Context>
```

The Notepad++ interface includes tabs for catalina.bat, web.xml, server.xml, tomcat-users.xml, ROOTxml, web.xml, and context.xml. The status bar at the bottom shows the file is an eXtensible Markup Language file, has a length of 487 lines, and was last modified on 13/07/2015 at 15:23.

12. Move to the new Tomcat 8 conf directory. Take a backup of the context.xml, server.xml, tomcat-users.xml and web.xml files.
13. Edit the context.xml file and find the <context> section title around line 19. Edit the title to read <context reloadable="true"> save the file.

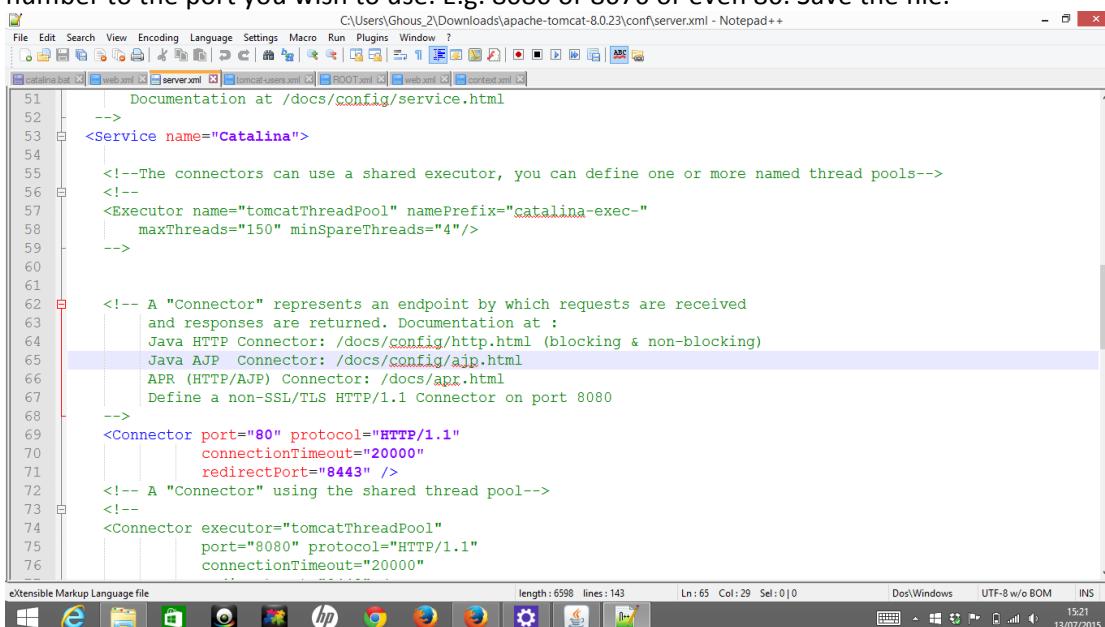

```

14      WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
15      See the License for the specific language governing permissions and
16      limitations under the License.
17      -->
18      <!-- The contents of this file will be loaded for each web application -->
19      <Context reloadable="True">
20
21          <!-- Default set of monitored resources. If one of these changes, the -->
22          <!-- web application will be reloaded. -->
23          <WatchedResource>WEB-INF/web.xml</WatchedResource>
24          <WatchedResource>${catalina.base}/conf/web.xml</WatchedResource>
25
26          <!-- Uncomment this to disable session persistence across Tomcat restarts -->
27          <!--
28          <Manager pathname="" />
29          -->
30
31          <!-- Uncomment this to enable Comet connection tracking (provides events
32          | on session expiration as well as webapp lifecycle) -->
33          <!--
34          <Valve className="org.apache.catalina.valves.CometConnectionManagerValve" />

```

This screenshot shows the Notepad++ interface with the context.xml file open. The XML code is displayed in green, indicating syntax highlighting. The file contains configuration for the Tomcat web application context, specifically setting the reloadable attribute to true. The Notepad++ status bar at the bottom shows the file length as 1631 lines and the current line as Ln:1 Col:1 Sel:0|0.

14. Edit the server.xml file and look for the connector port reference around line 69. Change the port number to the port you wish to use. E.g. 8080 or 8070 or even 80. Save the file.

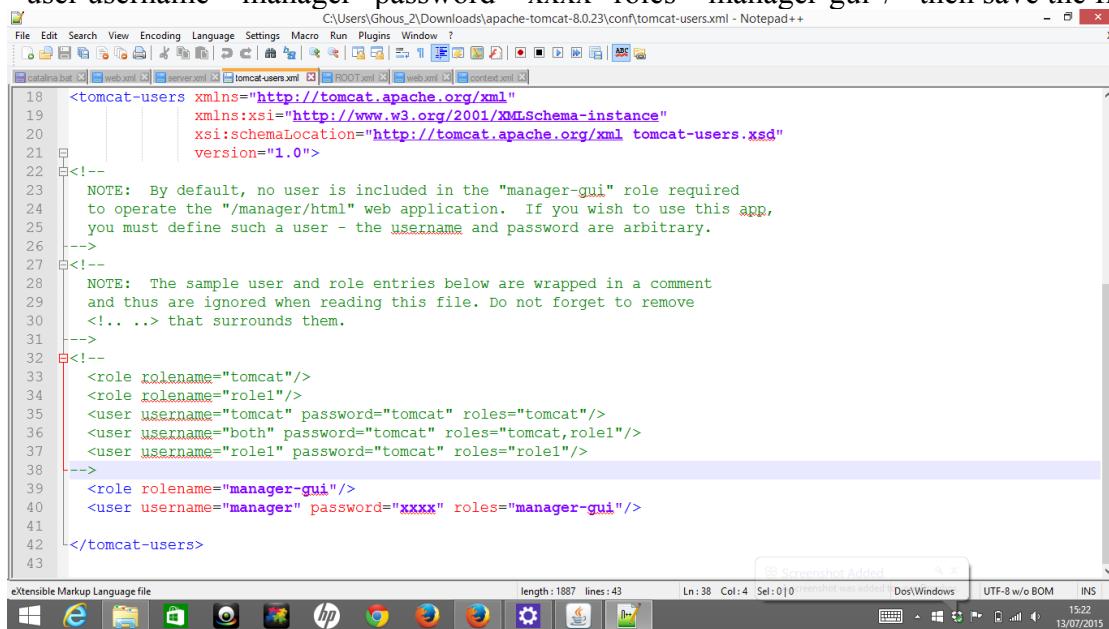

```

51      | Documentation at /docs/config/service.html
52      | -->
53      <Service name="Catalina">
54
55          | <!--The connectors can use a shared executor, you can define one or more named thread pools-->
56          | <!--
57          <Executor name="tomcatThreadPool" namePrefix="catalina-exec-"
58          |     maxThreads="150" minSpareThreads="4"/>
59
60
61
62          | <!-- A "Connector" represents an endpoint by which requests are received
63          |     and responses are returned. Documentation at :
64          |     Java HTTP Connector: /docs/config/http.html (blocking & non-blocking)
65          |     Java AJP Connector: /docs/config/ajp.html
66          |     APR (HTTP/AJP) Connector: /docs/apr.html
67          |     Define a non-SSL/TLS HTTP/1.1 Connector on port 8080
68          | -->
69          <Connector port="80" protocol="HTTP/1.1"
70              |     connectionTimeout="20000"
71              |     redirectPort="8443" />
72
73          | <!-- A "Connector" using the shared thread pool-->
74          <Connector executor="tomcatThreadPool"
75              |     port="8080" protocol="HTTP/1.1"
76              |     connectionTimeout="20000"

```

This screenshot shows the Notepad++ interface with the server.xml file open. The XML code is displayed in green, indicating syntax highlighting. The file contains configuration for the Tomcat server, specifically defining a connector on port 8080. The Notepad++ status bar at the bottom shows the file length as 6598 lines and the current line as Ln:65 Col:29 Sel:0|0.

15. Edit the tomcat-users.xml file. Note the comments notes around the users and roles. Within the file, below the close comment and above the </tomcat-users> line, insert two new lines reading:  
<role rolename="manager-gui"/>  
<user username="manager" password="xxxx" roles="manager-gui"/> then save the file.

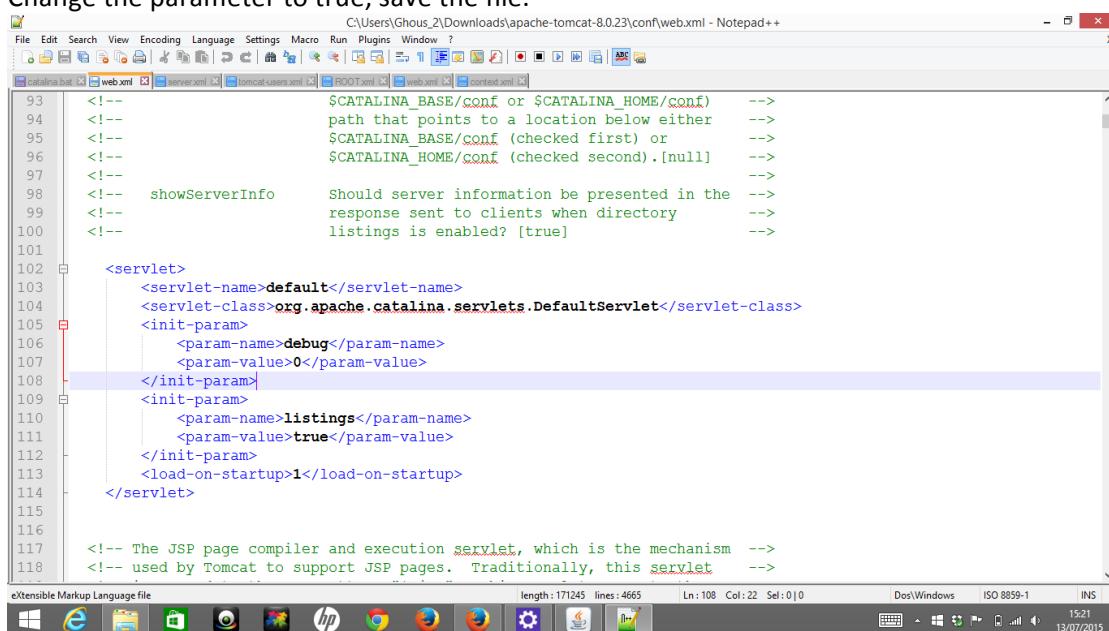

```

18 <tomcat-users xmlns="http://tomcat.apache.org/xml"
19   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
20   xsi:schemaLocation="http://tomcat.apache.org/xml tomcat-users.xsd"
21   version="1.0">
22 <!--
23   NOTE: By default, no user is included in the "manager-gui" role required
24   to operate the "/manager/html" web application. If you wish to use this app,
25   you must define such a user - the username and password are arbitrary.
26 -->
27 <!--
28   NOTE: The sample user and role entries below are wrapped in a comment
29   and thus are ignored when reading this file. Do not forget to remove
30   <!... ...> that surrounds them.
31 -->
32 <!--
33   <role rolename="tomcat"/>
34   <role rolename="role1"/>
35   <user username="tomcat" password="tomcat" roles="tomcat"/>
36   <user username="both" password="tomcat" roles="tomcat,role1"/>
37   <user username="role1" password="tomcat" roles="role1"/>
38 -->
39   <role rolename="manager-gui"/>
40   <user username="manager" password="xxxx" roles="manager-gui"/>
41
42 </tomcat-users>
43

```

16. Edit the web.xml file and find the <param-value>false</param-value> on or around line 111. Change the parameter to true, save the file.

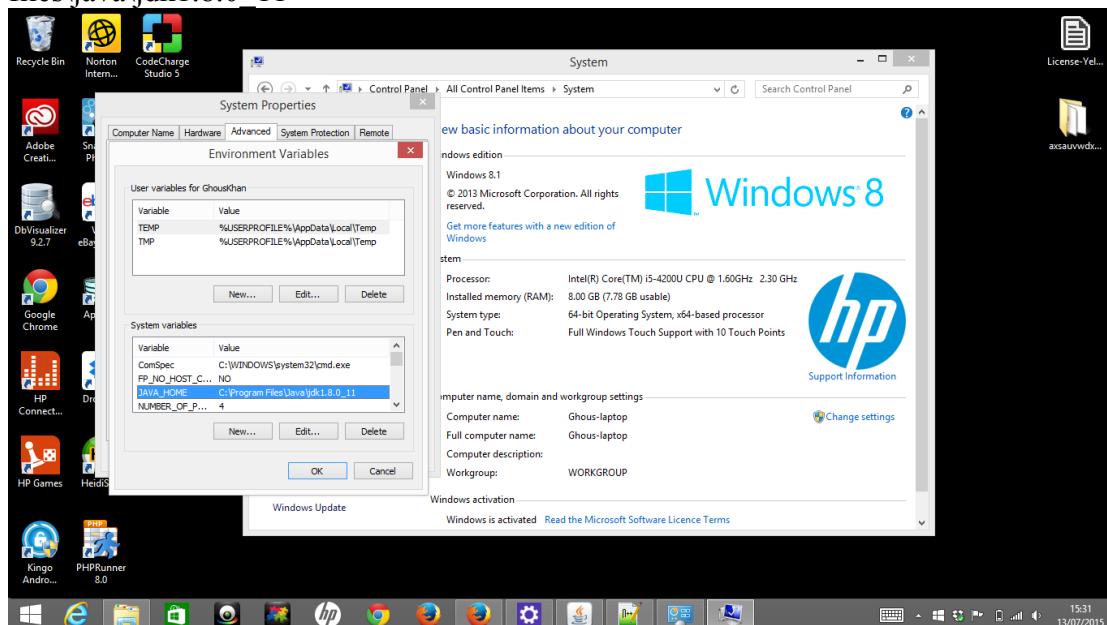

```

93 <!-- $CATALINA_BASE/conf or $CATALINA_HOME/conf -->
94 <!-- path that points to a location below either -->
95 <!-- $CATALINA_BASE/conf (checked first) or -->
96 <!-- $CATALINA_HOME/conf (checked second). [null] -->

115
116
117 <!-- The JSP page compiler and execution servlet, which is the mechanism -->
118 <!-- used by Tomcat to support JSP pages. Traditionally, this servlet -->

```

17. Ensure you have a system variable set to point to the Java home directory, get this parameter by looking for your to do this enter your control panel, system then Advanced system settings and then the environment variables button.

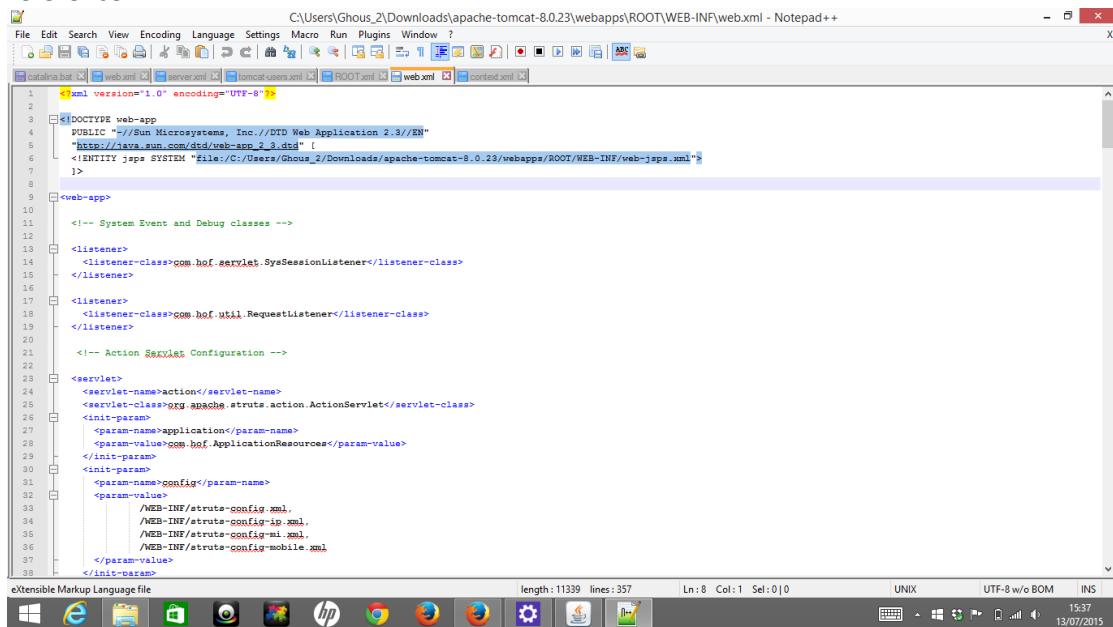

Set or edit either the user variable or a system variable to be: JAVA\_HOME with a value of the directory your java jdk is installed. Typically this would be c:\program files\java\jdk1.8.0\_11

18. Edit the catalina.bat within your old Yellowfin install, within the bin folder. Copy the section from setlocal (around line 94) through to around line 129 (just above the rem Suppress Terminate batch job on CTRL+C. Open the catalina.bat file in the bin directory of your new Tomcat install and paste the copy lines in below the setlocal entry at around line 94.

```
*C:\Users\Ghouz\Downloads\apache-tomcat-8.0.23\bin\catalina.bat - Notepad++
File Edit Search View Encoding Language Settings Macro Run Plugins Window ?

38         </init-param>

```

20. Re-Start your PC for the variables to take hold.  
 21. Launch Tomcat 8 from the startup.bat file within your new Tomcat 8 bin directory.  
 22. Once loaded, open a browser and move to the URL localhost:<port> (i.e. the port you entered at point 14). You should see the Yellowfin login page.  
 23. To confirm Tomcat 8 is running, move to Administration, Admin Console and select the System Information from the right hand menu. Select Application server and you should see Apache Tomcat/8.0.23 (or the version number you installed)

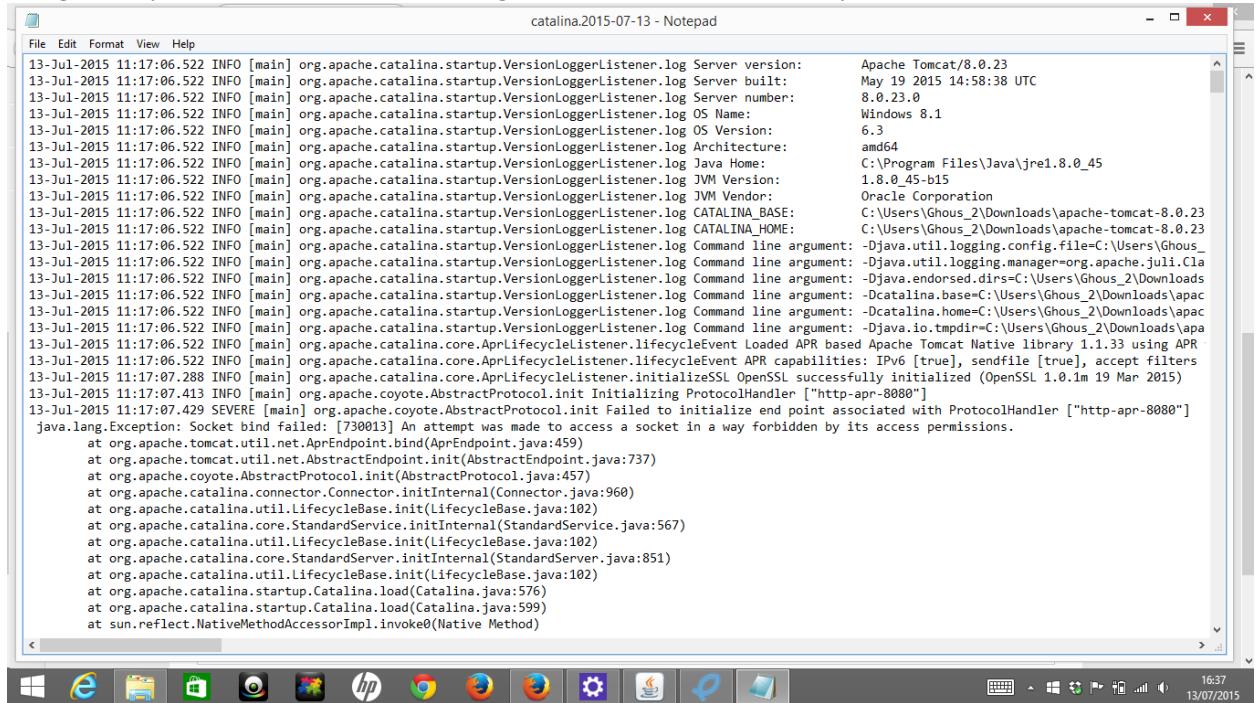

System Information	
Application Version:	7.1
Build:	20150624
Java Version:	1.8.0_11
Operating System:	Windows 8.1 6.3 (amd64)

Application Server	
Application Server:	Apache Tomcat/8.0.23
Servlet API Version:	3.1
JSP API Version:	2.3

24. You can also reference the Tomcat log files to see the version currently running. To do this navigate to your new Tomcat 8 folder /logs and look at catalina.<todays date>

The screenshot shows a Windows desktop environment. In the center is a Notepad window titled "catalina.2015-07-13 - Notepad". The window contains a large amount of text, which is the Tomcat startup log for July 13, 2015. The log details the server's initialization, including the Java version (1.8.0\_45-b15), JVM vendor (Oracle Corporation), and various system properties like CATALINA\_HOME and CATALINA\_BASE. It also includes a stack trace for a SEVERE error where a socket bind failed due to access permissions. The desktop taskbar at the bottom shows icons for various applications like File Explorer, Internet Explorer, and the Start button. The system tray on the right shows the date (13/07/2015) and time (16:37).
